<b>Описание</b>			
ижняя половинка картинки ломается (ну как у колпакова тоже бывало) после перезапуска моей программы такая ситуация остается так что видимо прошивка такое присылать иногда начинает эта же проблема раньше также наблюдалась при использовании конфигуратора как специально воспроизвести проблему непонятно - возникает сама изредка

СРАВНЕНИЕ ПРИНЯТЫХ ПАКЕТОВ ДЛЯ ВЕРХНЕЙ И ДЛЯ НИЖНЕЙ ПОЛОВИНЫ КАДРА

данные начинаются посмещению 22  
формат каждого пикселя 16 бит без знака little endian

у верхнего полукадра (nSPI: 0 ) видим что значанеи с 1 в старших битах байта встречаются только по четным смещениям а по нечетным их нет

а вот у нижнего полукадра видим очень много странных значение - все нули а вот например по смещению 189 значение 0xAC==8b\*10101100

тк нулей много то откуда начинается сбойное место непонятно ну и вообще нулей столько не должно быть в нижнем полукadre судя по верхнему

какраз до этого отработал алгоритм коррекции подставки и обе половины кадра были действительно практически одинаковыми

ОСТАНОВКА И ЗАПУСК КАМЕРЫ КОМДОЙ ОТ ПК СИТУАЦИИ НЕ МЕНЯЮТ - НИЖНИЙ ПОЛУКАДР ОСТАЕТСЯ ИСПОРЧЕННЫМ!!!

наверное надо подловив такую ситуацию нужно попытаться перепрошить и перезапустить контроллер без загрузки битстрима в ПЛИС и проверить пропадет ли ошибка

#### #8 - 20.07.2020 03:59 - Александр Р

закомментировал загрузку ПЛИС в контроллере и перепрошил его не выключая питания

и от камеры пакеты вообще перестали приходить - даже биконы

возможно при перепрошивке процессора для ПЛИС тоже каким-то образом аппаратно ресет делается? нужно проверять как такой трюк с перепрошивкой работает и не влияет ли на ПЛИС когда все штатно

перепрошивка контроллера с загрузкой битстрима в ПЛИС пробелму устранило (до следующего раза когда опять возникнет)
